Gout Symptoms

Gout is a very distressing form of arthritis. Gout occurs whilst there is an profusion of *uric acid* built up in the body. As soon as there is a buildup of *Uric acid* present in the body the consequence can include such as piercing uric acid crystals in the joints all the way through the body, especially appearing in the big feet, other deposits of uric acid, which are called, tophi that seem to be very much like lumps underneath the skin, and the development of kidney stones, which are a consequence through a buildup of uric acids within the kidneys.

For the majority of persons, who are unlucky enough to build up gout, it for the most part, often strikes in the area of the big toe. Often the gout attack can be relentless and extremely excruciating equally issues awakens one coming from sleep at the time the attack takes place. The big toe, which is nduced with gout is very hypersensitive as well as sore and often times very hot and blown upwards. *Gout symptoms* can be broken down into four key stages:

Asymptomatic Hyperuricemia is the earliest stage of gout in which you will not feel any gout symptoms but gout is opening to form. In stage one the *uric acid levels* are elevated and it needs to be taken charge of so that the uric acid does not precipitate out of blood and subsequently transform to be crystallized in renal system or the joints.

The Subsequent Period of Gout is Acute Gout or Acute Gouty Joint Disease

It is at stage two that gout starts to result in injury in order to the body. Elevated levels of uric acid design it so it is not possible for the blood to keep it in a form that is dissolved and it begins to crystallize and then be deposited in joint spaces. This is when agony as well as swelling then occurs. Attacks in general come about during the night time and if not treated could continue for weeks at a time. If not treated still the attacks turn out to be much more brutal and keep going for longer periods of time.

“ The third stage of gout is Intercritical gout equally this is the time when a good an attack of gout has subsided. In stage three there are no signs and symptoms but it is while the body's immune system is backing itself for extra attacks on the uric acid crystals which form for the reason that of the elevated concentration of blood. If the person suffering from gout does not get hold of treatment by stage three the disease can be very problematical to control.

The fourth and final stage of gout is chronic gout, which can be the nastiest and most destructive stage of the disease. By stage four the particular gout has caused lasting disability to the joints and in individual cases the filtering system as well. From stage four the associated shared can turn out to be deteriorated and also cause extreme anguish which can be crippling. In extreme cases the kidney can get rid of its functions which can result to kidney failure and death. Gout is a disease like many others which builds upon itself if not treated at the opening stages. By recognising the gout symptoms near the start and being checked by a physician of medicine you can reduce the odds of gout developing to the latter levels.
