

# The Relation between Gout and Kidney Stones

**G**out occurrences in certain individuals may be attributed to their kidney problems. Uric chemicals present in purines are usually excreted out of the system and are not expected to be totally absorbed by the body. Uric acid levels are not wholly dependent in the amounts of purine rich food that body takes in.

Is also dependent on the ability of the kidney to excrete uric acids out of the system. Failure to excrete uric acid may cause uric acid in order to amass and reach the high-level point when uric acid crystals form and cause gout aches and pains. Hence, it has an existing romantic relationship between gout and kidney stones.

- The kidney's power to excrete will be affected by the formation of kidney stones.
- If the kidneys become impaired, excretion after that poses a problem of retaining an excessive amount of uric acid in the blood stream.

*“ As uric acid amasses it will reach a certain level wherein uric acid will crystallize and lodge themselves in an individual's joint where they will not be bothered. Hence, gout and kidney stones forge a relationship by the failure of the kidney to excrete uric acids and the ability of amassed uric acid to form into crystals that creates gout.*

## Causes and Also Treatments of Kidney Stones

Unlike gout, crystalline substances become kidney stones not only out of uric acids but also out of other insoluble substances that collect and combine in the kidney system. Insoluble substances tend to be called oxalates which usually can either be salt, calcium or amino acids (cystine kidney stones).

## The Kidney Stone Sufferer Must Pay Attention to His / Her Diet

If the kidney stones are acid oxalates, then your kidney sufferer's diet should have more alkalines to be able to neutralize the particular acid oxalates. An alkaline diet mainly consists of fruits and vegetables.

“

*Low Purine Diet - Foods You must Avoid in a Low Purine Diet Purines are at the heart of your gout. And so a low purine diet is a key part of the gout remedy. Purines in your body provide the protein and energy you need. But during the process the purines breakdown, forming uric acid as a byproduct. When...*

- Dark red berries and cherries are the most recommended fruits to eat for people with kidney stones caused by acid oxalates.
- Cherries and berries include chemical nutrition that lower uric acid and have the ability to reduce inflammation.
- Hence, cherries or fruits will not only neutralize the kidney stones but will also prevent gout because it can lower uric acid levels.

On the other hand, vegetable like spinach, asparagus and cauliflower although rich in alkaline are also rich in purines. Hence, if you are on an alkaline based diet, avoid these types of vegetables because they are liable to increase uric amounts via their purine wealthy content.

Through this example, it is very important then to see the type of kidney stones you are suffering from in order to determine the type of food you should eat. Following that, it should be additional determined which of the foods belonging to a food group is rich in purine. In this way the treatment of any type of kidney stone will not result to increasing the level of uric acid that may later form into uric acid gout crystals.

The above therefore presents the relationship among gout and kidney stones. Diet plays an important role but it is also a matter of discerning how a awareness of one chemical nutrient may cause a condition in another part of the body's system.
