

# What Is Gout and How can you Deal With It?

**G**out is a type of arthritis that causes painful, red, inflamed joints. Although nearly any joint in the body can be affected (such as the knee, shoulder, ankle, fingers and toes) the most commonly involved combined is located at the foot of the big toe. Gout (also called gouty arthritis) is characterized by sudden inflammatory reactions or attacks that frequently happen in the middle of the night or during the early morning hours.

This condition occurs when like high levels of **uric acid** build up in the body that the **uric acid** begins to solidify, resulting in the formation of tiny crystals. These uric acid crystals can accumulate in parts of the anatomy, especially in joints and connective cells in the lower half of the body. Not only can the build up of uric acid crystals temporarily injure joints, but permanent damage can be done to be able to joints and also surrounding tissues if the disease remains untreated.

## Gout Has Multiple Causes and Risk Factors Associated With It

For example, being overweight increases the chances of getting this kind of arthritis. Gout usually affects men. Diets that are an excellent source of red meat (especially game meats), certain seafood (such as sardines, trout, scallops, and mackerel), gravy, and alcohol increase the odds of developing gout. It is for this reason that gout has been historically associated as a condition that targets the wealthy upper class. Certain medications (such as aspirin) and chronic health conditions can increase your chances of getting this disorder. Genetic factors also play a role. An injury to the joints can result in a **gout attack** in people who currently have high levels of uric acid.

- Symptoms of gout include attacks of extreme pain in the joints, especially including the big toe (a condition known as podagra).
- In addition to pain, many people experience a red discoloration of the surrounding skin and a loss of joint mobility.
- These attacks can last for several days after that will gradually subside.

*Gout and Stress - How Reducing Stress Can help Your Gout When your stress levels increase this increases your metabolism. Now when this happens more uric acid is actually made in your body. High levels of uric acid produce uric acid crystals in your joints, causing painful gout. You can now see that there...*

Effective prevention and treatment of **gouty arthritis** involve a number of important lifestyle changes. People who suffer from obesity should speak with their healthcare service provider about a diet and exercise program that fits their specific needs. Weight needs to be missing slowly but consistently in order to avoid triggering gout flare-ups. All people suffering from this form of arthritis ought to limit their consumption of foods high in **purines** because purines are the chemicals in our food that your body metabolize in to uric acid. Other dietary changes include: restricting alcohol intake, avoiding high fructose corn syrup, and drinking more water.

Speak with your doctor if you suspect that you have gout, and also to see if you are a candidate for receiving medications to lower **uric acid levels**. More natural forms of treatment include eating one cup of fresh cherries a day (or drinking cherry juice), because this seems to lower the risk of recurrent gout attacks. Some people claim that drinking a tablespoon of apple cider vinegar diluted in water each day can increase the interval between attacks.
